

## **ABSTRACT OF THE DISCLOSURE**

Exemplary embodiments disclose a fastening system with an object including a securement structure with an extension element adapted to be compressed by a fastener. A portion of the securement structure extends above a first end of a compression reinforcement device. The extension element is adapted to be compressed by a fastener such that the portion of the securement structure is positioned substantially level with the first end and wherein the compression reinforcement device and the securement structure both receive compressive force from a fastener.
